

A PROJECT REPORT ON

O'Nest Home Stay

Submitted in partial fulfillment for Degree of

MASTER OF COMPUTER APPLICATION

By

Ms. Kaveri V. Kadam

Under the guidance of

Prof. Harshada U. Salvi
(Department of MCA)

Submitted to

Department of MCA

**FINOLEX ACADEMY OF MANAGEMENT AND
TECHNOLOGY, RATNAGIRI**

**FINOLEX ACADEMY OF MANAGEMENT AND TECHNOLOGY,
RATNAGIRI**

This is to certify that the project report titled:

O'Nest Home Stay

Submitted By:

Ms. Kaveri V. Kadam

In partial fulfillment of the award for degree of

MASTER OF COMPUTER APPLICATION

From Mumbai University

And is the bonafide record of the work done by her during the Semester

II of A.Y. 2025-2026

Internal Guide

(Prof. Harshada U. Salvi)

HOD

(Prof. Tejas V. Joshi)

ACKNOWLEDGEMENT

It is our prime duty to offer sincere gratitude to University of Mumbai to include the project work in the syllabus of First year in Master of Computer Application Course so as to developed interest about research work among the students like us. We wish to express our sincere thanks to Dr. Kaushal Prasad, Principal of Finolex Academy of Management and Technology, Ratnagiri for providing all necessary facilities of Laboratory and Library at Finolex Academy of Management and Technology. We wish to express our sincere thanks to Prof. Tejas V. Joshi, Head of the Department of MCA and project guide Prof. Harshada U. Salvi for giving us the opportunity to complete the project work by providing facilities in the department and providing valuable guidance to complete the task also helped out in clearing concepts about the project. Last but not the least our special thanks to our parents, our friends and all those peoples who have encouraged us, helped us to complete this course successfully in time.

Ms. Kaveri Vijay Kadam

ABSTRACT

This project presents a dynamic online booking solution for O’Nest Home Stay Resort, designed to enhance both customer and administrative experiences. The website provides a platform where users can easily search for room availability, book accommodations, and manage their reservations, including the ability to cancel bookings. Users can also leave reviews to share their experiences with others.

From an administrative perspective, the platform offers powerful tools for managing the resort’s operations. Admins can add or update room details, add new rooms and delete rooms as needed, and handle booking records efficiently. Additionally, administrators have the capability to manage user accounts and reviews, ensuring that only relevant and appropriate feedback is published. The system also includes a feature that allows the admin to temporarily shut down the website for maintenance or other reasons, ensuring that the booking process can be paused as needed without affecting operational integrity.

Built with modern web technologies such as HTML, CSS, PHP, and MySQL, this project delivers a reliable, scalable, and secure online booking system. The goal is to improve the efficiency of the reservation process and administrative tasks while providing an engaging and convenient user experience for guests at O’Nest Home Stay.

INTRODUCTION

The hospitality industry is rapidly adopting digital technologies to improve customer experience and simplify management operations. Traditional methods of handling room reservations and customer records manually are time-consuming, less efficient, and prone to errors. To address these challenges, online booking systems have become an essential solution for modern resorts and homestays.

The proposed project, O'Nest Home Stay is designed to provide an efficient and user-friendly platform for managing resort and homestay operations. The system allows customers to view available rooms, check room details, make reservations, and manage bookings through an online interface. It also provides an administrative module through which the administrator can manage room information, customer details, reservations, and other operational activities effectively.

The system is developed using web technologies such as HTML, CSS, Bootstrap, JavaScript, PHP, and MySQL. The frontend is designed to provide an interactive and responsive user interface, while the backend handles authentication, booking processes, and database management. MySQL is used to securely store and manage all necessary data including customer records, room details, and reservation information.

The primary objective of this project is to automate the booking process, reduce manual workload, improve accuracy, and provide better customer service. The system offers a convenient and accessible platform for both customers and administrators, thereby enhancing operational efficiency and user satisfaction.

This project demonstrates the practical application of web development technologies, database management systems, and software engineering concepts in the hospitality domain. In the future, the system can be further enhanced by integrating online payment gateways, email notifications, mobile application support, and advanced reporting features.

Objective of Project

The main objective of the **O'Nest Home Stay Website** is to provide users with a simple, secure, and efficient platform for online room booking and resort management. The project aims to simplify the reservation process and improve the overall customer experience through a web-based system.

The specific objectives of the project are:

- To design and develop a user-friendly web-based home stay booking system.
- To provide customers with an online facility to view rooms and make reservations easily.
- To allow the administrator to manage rooms, bookings, and customer details efficiently.
- To maintain customer and booking records securely using a database system.
- To reduce manual work and improve the accuracy of reservation management.
- To provide a responsive and accessible interface for better user experience.
- To enhance practical knowledge of web development and real-world application design.

Scope of Project

The scope of the **O'Nest Home Stay Website** defines the features and limitations of the system and highlights its practical applications. The project focuses on providing a reliable and user-friendly platform for online room booking and home stay management.

The scope of the project includes:

- The system is accessible through a web browser and can be used on desktop and mobile devices.
- Customers can view room details, availability, and booking information online.
- Users can register, log in, and make room reservations easily through the system.
- The administrator can manage rooms, bookings, customer details, and other related information.
- The system maintains booking and customer records securely using a database.
- The project provides a responsive and user-friendly interface for better user experience.
- The system helps reduce manual work and improves the efficiency of reservation management.

The system is designed for managing booking and administrative operations of a single home stay or resort efficiently.

System Study

Existing System:

The existing system for managing bookings at O’Nest Home Stay Resort primarily relies on manual processes and traditional methods. This may include phone bookings, walk-in reservations, and physical record-keeping, which can lead to inefficiencies and challenges in managing reservations and customer interactions.

Customers typically need to call or visit the resort in person to make or modify bookings, leading to potential errors and time delays.

Availability and room details are not updated in real-time, making it difficult for customers to obtain accurate information.

Booking details, customer information, and room availability are often managed using physical records or spread sheets, which can be prone to errors and difficult to manage.

Feedback is collected in person or through paper forms, which can be cumbersome to compile and analyse.

Resort staff manually handles booking records, cancellations, and room management, which can be time-consuming and less efficient

Limitations:

- Manual Booking Process
- Limited Availability Information
- Paper-Based Records
- Customer Feedback Through Paper Forms
- Manual Administrative Tasks

Proposed System:

The proposed **O’Nest Home Stay Booking Website** aims to automate and simplify the booking and management process through an online platform. The system improves efficiency, accessibility, and user experience with digital solutions.

Notable Features:

- Online room booking and reservation system.
- Real-time room availability updates.
- Secure digital storage of customer and booking records.
- Customer reviews and feedback management.
- Admin dashboard for managing rooms, bookings, and users.

Analysis and Design

Software/hardware Requirement Specification Software

Software Requirements:

- Front End/GUI Tools – HTML, CSS, Bootstrap, JavaScript
- Back End – PHP
- Database – MySQL
- Server – XAMPP
- Code Editor – Visual Studio Code

Hardware Requirements:

- RAM: 4 GB or more
- Processor: Intel i3 or higher
- Storage: 20 GB or more free space
- Screen Resolution: 1366×768 or higher
- System Type: 64-bit Operating System

SYSTEM DESIGN

Module Division:

The **O'Nest Home Stay Booking System** is divided into several modules to ensure better organization, maintainability, and efficient management of booking operations. Each module performs a specific function and works together to provide a smooth user experience.

User Authentication Module

- Handles user registration and login functionality
- Verifies user credentials and manages user sessions
- Ensures secure access to the system

User Management Module

- Stores and manages customer details such as name, email, and contact information
- Allows users to update profile information
- Maintains customer account records

Room Management Module

- Allows admin to add, update, and delete room details
- Stores room information such as room type, price, availability, and facilities
- Manages room availability status

Booking Management Module

- Allows customers to search and book available rooms
- Stores booking details such as check-in, check-out, and guest information
- Handles booking confirmation and cancellation

Feedback Management Module

- Allows customers to submit reviews and ratings
- Stores customer feedback for analysis and service improvement
- Helps maintain customer satisfaction

Dashboard & Reporting Module

- Displays booking details, room status, and customer information
- Provides an easy-to-use admin dashboard
- Helps administrators monitor overall system activities

Database Management Module

- Handles storage and retrieval of customer, room, booking, and feedback data
- Maintains data consistency and security using MySQL database

Conclusion

The **O'Nest Home Stay Booking System** is a web-based application developed to simplify and automate the process of room booking and home stay management. The system provides an efficient platform where customers can easily view room details, check availability, and make reservations online without depending on manual booking methods.

The project successfully integrates various modules such as user management, room management, booking management, feedback management, and admin control. These modules work together to provide a smooth, secure, and user-friendly experience for both customers and administrators. The use of technologies such as HTML, CSS, Bootstrap, JavaScript, PHP, and MySQL helped in developing a responsive and reliable system.

The system reduces paperwork, minimizes booking errors, improves data management, and saves time for both users and administrators. It also provides better accessibility and convenience by allowing bookings to be managed digitally through a web browser.

Overall, the project demonstrates the practical implementation of web development technologies and database management concepts in the hospitality domain. The developed system fulfills the main objectives of improving booking efficiency, enhancing customer experience, and simplifying administrative operations. With future enhancements such as online payment integration, mobile application support, and advanced analytics, the system can be further expanded into a more powerful and scalable solution.

Future Enhancement:

While the current system meets the essential operational requirements, several enhancements can be considered to improve functionality, scalability, and user experience in the future:

Mobile Application

Develop an Android/iOS mobile application to allow users to book rooms, check availability, and manage reservations anytime and anywhere.

Online Payment Integration

Implement secure online payment gateways to enable customers to make online booking payments conveniently.

Advanced Analytics & Reports

Introduce detailed booking reports, occupancy analysis, and graphical insights to help administrators analyze business performance.

AI-Based Recommendations

Integrate AI-based suggestions to recommend rooms and services based on customer preferences and booking history.
